Software Overview - Multimedia Chat:

Multimedia Group Chat:

This Multimedia chat app is developed using python3. The important components involved in this app are client and server(communicated using socket programming), GUI (implemented using kivy).

Clients on the same network can chat and share files with each other. The files and text messages are shared using socket programming.

Client:

The Client represents the end user who connects to other clients with the server being the intermediate transmitter. Instead of peer-to-peer communication of clients, all the clients are connected by the server.

Server:

Server transmits the message received from one client to all other clients connected to the server at that instant reinforcing the idea behind Multimedia Group chat.

Along with above components, key features like file transferring, GUI, audio and image transferring are supported by the software.

Graphic user interface:

The GUI is added to provide a better interface . GUI gives more functionality than CLI in terms of providing buttons and controlling thread processes efficiently.

The system design with block diagram or flowchart:

The baseline implementation consists of group text chats between all clients connected to the server in a client-server mannered connection. The server socket is first established and is open for listening requests from clients in the same local area network. The clients can then establish their own socket and connect to the server using the server address.

For group chat, the client needs to connect to the server instead of all other chats. This reduces the number of connections from $n*(n-1)/2$ to 'n' connections. (n - the number of clients).

Messages to be transferred from a sender client are sent to the server first, and then the server sends the message to all other receiver clients. Any client connected to the server can act as both sender and receiver.

Basic send(), recv() functions are used to transfer messages between client and server in both ways.

Threading:

In server:

- Once the server socket is established and activated, it is open for connection requests from clients.
- Each client connection creates a new thread in the server. Disconnecting the client from the server results in the ending of this thread.
- The server can be terminated by using a keyboard interruption. The server will still be active when all clients disconnect. try,

except methods are used for detecting keyboard interrupts and taking necessary actions.

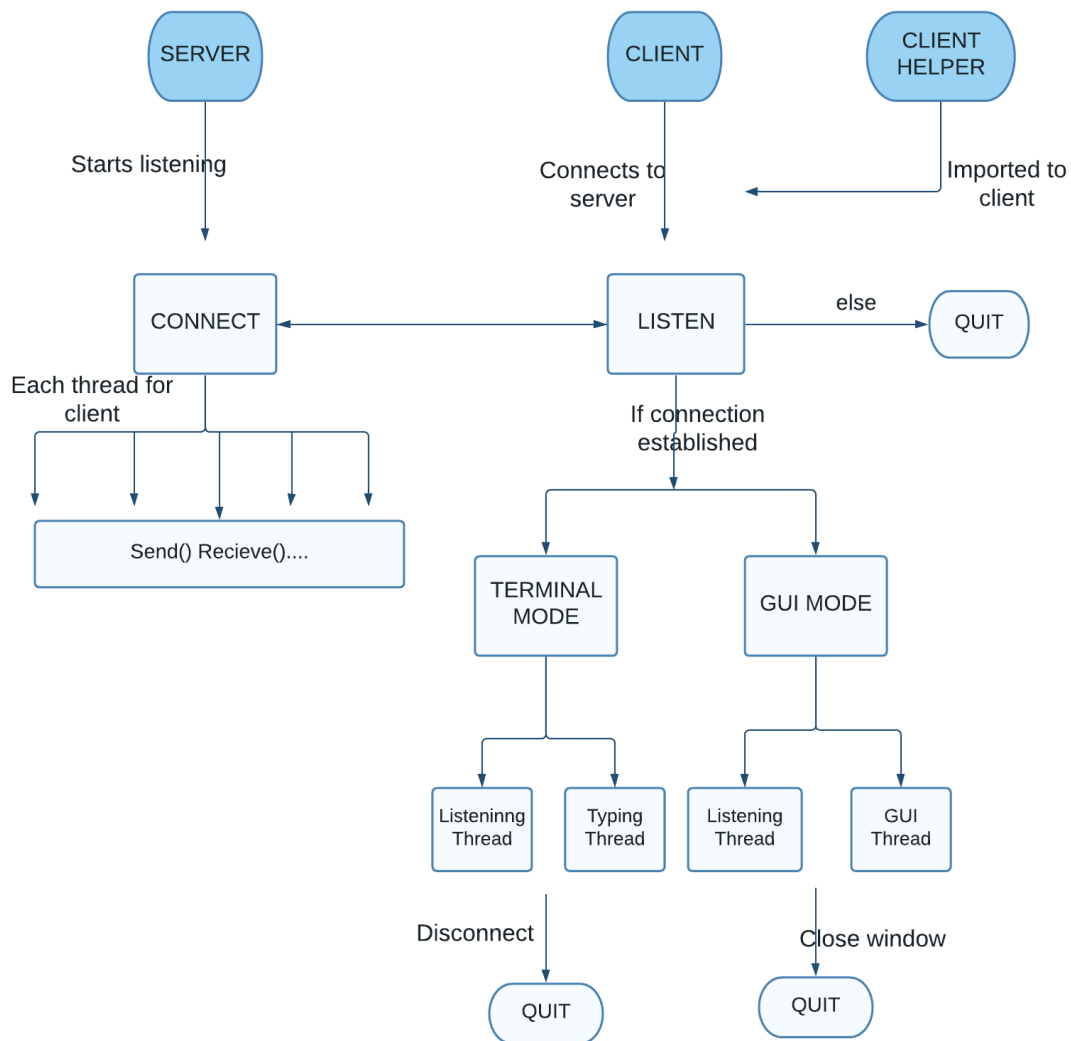

In client:

To establish a two way communication, two threads(namely listening thread and typing thread) are forked from the main thread of the client. When a successful connection is established, the client gets an option for either CLI or GUI. Both interfaces allow you to chat, and share files of multiple formats. !q cmd is used to disconnect from server in CLI and closing of the pop-up box in GUI will disconnect the client from server.

Features:

- Text chat
- File attachments
- Image, Audio and Video sharing
- Graphic User Interface

Block Diagram of System Design:

References:

1. [Kivy tutorials](#)
2. [Socket Programming in Python](#)

Screenshots of Results of our working Software:

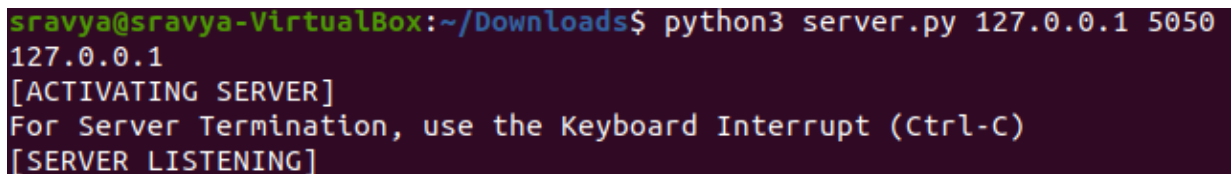

1. Initializing server for first time

The Server gets started by the command -

\$ python3 server.py <ipv4address> <portNo>

in which <ipv4address> implies the ipv4 address of the host where the server.py file resides and <portNo> implies port through which it listens. In the terminal, it displays “Activating Server” and shows that, use the command “ctrl+c” - for server termination. Along all of this, it shows “Server Listening” implying that the server is currently open and any client within the same network or host can join/connect to the server.

Server:

A terminal window with a dark purple background. The prompt is 'savya@savya-VirtualBox:~/Downloads\$'. The command 'python3 server.py 127.0.0.1 5050' has been entered. The output shows '127.0.0.1' on a new line, followed by '[ACTIVATING SERVER]' on the next line. Then, 'For Server Termination, use the Keyboard Interrupt (Ctrl-C)' is displayed. Finally, '[SERVER LISTENING]' is shown on the last line, with a cursor at the end.

```
savya@savya-VirtualBox:~/Downloads$ python3 server.py 127.0.0.1 5050
127.0.0.1
[ACTIVATING SERVER]
For Server Termination, use the Keyboard Interrupt (Ctrl-C)
[SERVER LISTENING]
```

2. Client Joining the server

The Client can join the server given the IP address of server host and Port Number, by the command -

\$ python3 client.py <ipv4address> <portNo>

A. On choosing Correct Address

For Client, it then displays “Would you like to join (yes/no)”, on typing “yes”, “Press 1 for CLI and 2 for GUI”, and it asks the Client to “Enter your name”, finally, showing “<Client_name> has joined the chat”

```

sravya@sravya-VirtualBox:~/Downloads$ python3 client.py 127.0.0.1 5050

GroupMediaChat

You have joined the group chat

sanjay joined the chat!

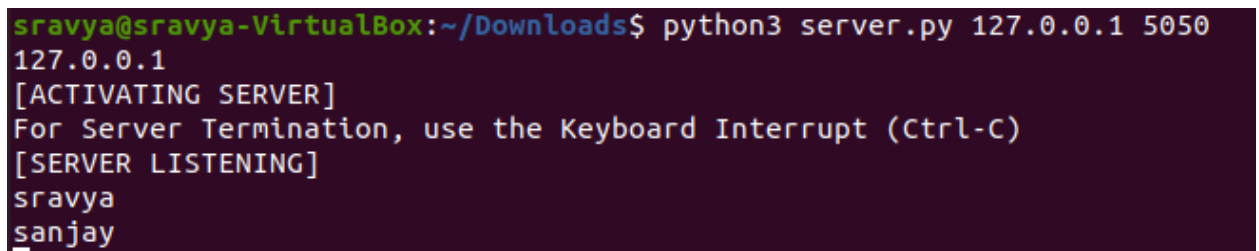

Client2:

The screenshot shows a terminal window on the left and a graphical window titled "GroupMediaChat" on the right. The terminal displays the output of running `python3 client.py 127.0.0.1 5050`. It shows various system logs for Kivy, Python, and OpenGL, followed by a prompt to connect (yes/no) and a preference mode selection (1. Terminal Mode, 2. GUI Mode). The user selects GUI Mode and enters their name "sanjay". The terminal then displays detailed OpenGL and SDL2 initialization information. The "GroupMediaChat" window shows a green status message: "You have joined the group chat". At the bottom of the window are two buttons: "Attach File" and "Send".
